The invention relates to rat GM1-specific alphal-2fucosyltransferase (alphal-2FucT) enzyme and its corresponding nucleic acid. This nucleic acid is specific for a carbohydrate moiety found in ganglioside GM1, a terminal galactose betal-378-acetylgalactosamine (Galbetal-3GalNAc) saccharide. Alphal-2FucT DNA is useful for producing rat alphal-2FucT protein by recombinant techniques. Alphal-2FucT DNA is useful for the preparative synthesis of fucosyl containing glycolipids, glycoproteins, glycolipoproteins and oligosaccharide, and for preparing fucosyl GM1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Rat hepatoma H35 cell alphal-2fucosyltransferase, useful for producing GMI-specific alphal-2fucosyltransferase enzyme by recombinant techniques and for detecting oncogenic transformation of test tissues

Since alphal-2FucT is activated in cell transformation, antisense sequences derived from alphal-2FucT DNA are useful for inhibiting, suppressing or treating cancer. Alphal-2FucT DNA is useful in gene therapy and antisense therapy. The present sequence is rat hepatoma H35 cell

                                                                                                                                                                                                                                                                                                                                                                              Qy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      (SE or FUT2), a type II integral membrane profession affinity of type I and type III substrates. Its amino acid sequence was deduced from the nucleotide sequence of a genomic DNA clone (see AAV2903) isolated from a pig liver library on the basis of homology to human FUT2 cDNA. Pig FUT2 shows 83.2% identity with human FUT2. Expression of a glycosyltransferase, such as porcine Se, in a tissue results in reduced expression of unwanted carbohydrate epitopes on the tissue, especially porcine heart, liver, kidney or pancreas, rendering it more suitable for transplantation, i.e. less immunogenic and of increased immunological acceptability. A claimed method of producing a cell from a donor species that is immunologically acceptable to a recipient species involves reducing levels of carbohydrate on the donor cell that causes it to be recognised as non-self by the recipient by expressing a nucleic acid for a glycosyltransferase such as porcine Se in the cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 \Omega Y
                                                                                                                                                                                                                                                                                                                                                                                                                   present invention. The present invention describes nucleic acids (NA) domain of a first glycosyltransferase. The NAs comprise a catalytic a second Gr, whereby when the NA is expressed in a localisation signal of a second Gr, whereby when the NA is expressed in a cell and where the compete for substrate with a second Gr, resulting in reduced levels of a product from the second Gr. The NAS can be used to produce cells and organs with desired glycosylation patterns. Products and methods of the epitopes in cells, tissues or organs which may be used to reduce the levels of transplantation or gene therapy.

The DKA encodes a alpha(1,2) fucosyltransferase and is the Secretor alpha(1,2) fucosyltransferase locus, that cross hybridises with the B blood group alpha(1,2)fucosyltransferase gene. The DKA is useful for producing a recombinant human GDP-L-fucose:beta-D-galactoside 2-alpha-L-fucosyltransferase (FUT2) which can be used for genotyping an individual as a secretor or nonsecretor as it is known that nonsecretors homozygous for a mutant allele of the FUT2 gene that has a stop codon in the position corresponding to amino acid 143.
                                                                                                                                                                                                                                                                               Sec2; alpha(1,2) fucosyltransferase; H blood group; secretor genotyping; GDP-L-fucose:beta-D-galactoside 2-alpha-L-fucosyltransferase; human;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                GVHVRRGDYVHVMPNVWKGVVADRGYLEKALDMFRARYSSPVFVVYTSNGMAWCRENINAS 240

The functional protein is represented by amino acids 33 to 365. The enzyme produced by the DNA sequence can be used in enzymatic (grosyltation of chain-terminating galactose residues on lactosemence or neolacto type beta-D-galactoside to alpha-2-L-fucose residues. The protein or large callular fraction is useful for synthesis of a molecule comprising Fucalphal-2dalbetal-3GalNaA. a glycollipid, glycoprotein, glycolliportein or a free oligosaccharide comprising Fucalphal-2Galbetal-3GalNaC. The method involves contacting alphal-2fucosyltransferase with GDP-fucose and a molecule or glycolpid, glycoprotein, glycolipoprotein or oligosaccharide having a terminal Galbetal-3GalNAC group. It is also useful for synthesis of fucosyl-GM_1 by contacting the protein with GDP-fucose and ganglioside GM_1. The obtained glycoproteins, glycolipids and oligosaccharides are useful as nutritional compositions and fucosyl-GM_1 is useful for inducing an immunosuppressive action against cancer, neurological disease or small cell lung carcinoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New rat ganglioside GMI-specific alphal-2Fucosyltransferase, useful for preparation of fucosyl GMI which is useful as a nutritional composition or immunotherapeutic for cancer and neurological diseases
                                                                                                                                                                                                                                                                                                                                                                              neuroprotective; nootropic; gene therapy; Fucalphal-2Galbetal-3GalNAC; immunotherapy; immunosuppression; cancer; neurological disease; small cell lung carcinoma.

The enzyme is responsible for the synthesis of 2'-fucosyllactose, one of the oligosaccharides in human milk. Other products of Fuc-T include glycoprotiens contg. beta-linked terminal galactose residues which can be fucosylated by Fuc-T. This DNA can be used to produce non-human transgenic mammals able to produce secondary gene products, e.g. oligosaccharides, in their milk. The transgenic mammals milk blochemically resembles human milk. This humanised milk can be used in the prepn. of an enteral nutritional product useful in the nutritive maintenance of an animal.

(AAT01082) isolated from a human epidermal carcinoma cell line A431 cDNA library. The enzyme can be expressed in the milk of a Lransgenic mammal, esp. cow. This allows large-scale prodn. of oligosaccharides or glycosylated proteins and lipids in the milk.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The human H-transferase (AAR80572) product of a cDNA clone (AAT12238) prepd. from human epidermoid carcinoma cells (ATCC CRL 155 A-431) can be expressed in xenogeneic organs, tissues and cells using a vector such as papex-1 (AAT1239). This results in decreased expression of the non-human antigen galactose alpha(1.3) galactose on the surface of the organs etc. so that hyperacute rejection is reduced upon transplantation to humans.

KAM13640) is an enzyme involved in the expression of type I and II clood group H structures. Its amino acid sequence was deduced
CC (AAM13640) is an enzyme involved in the expression of type I and II clood group H structures. Its amino acid sequence was deduced
CC Expression of the fucosyltransferase animal cell lines provides
CC specific capabilities with respect to post-translational
modification of the oligosaccharides of expressed proteins or
CC lucosylation of chain-terminating galactose residues on
lactoseamine or neolacto type beta-D-galactose to alpha-2-
CC dicose residues. The enzyme can also be used to raise antibodies
CC as diagnostic reagents and to screen cpds. for fucosyltransferase
CC inhibitor activity.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 6, Appendence 11, Percence 12, Perc

Patent No. 6329170
EALERAL INDORMATION:
APPLICANT: Eric H. Holmes et al.
TITLE OF INVENTION: NUCLEIC ACIDS AND PROTEINS OF A RAI GANGLICSIDE
TITLE OF INVENTION: GMI-SPECIFIC ALPHAI-2 FUGOSYLTRANSFERASE AND USES
TITLE OF INVENTION: THEREOF
FILE REPERBENCE: 8511-029
CURRENT APPLICATION NUMBER: US/09/298,886
CURRENT FILING DATE: 1999-04-26
SOFTWARE: Patentin Ver. 2.0
SEQ ID NO 8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           APPLICANT: SANDRIN, MAURO S.

                                                                                                                                                                                                                                           Sequence 6, Application US/08525058A
Sequence 6, Application US/08525058A
Patent No. 5770420
GENERAL INFORMATION:
APPLICANT: LOWE, JOHN B.
ATTILE OF INVENTION: METHODS AND PRODUCTS FOR THE SYNTHESIS
TITLE OF INVENTION: OF OLIGOSACCHARIDE STRUCTURES ON GLYCOPROTEINS,
TITLE OF INVENTION: GLYCOLIPIDS, OR AS FREE MOLECULES, AND FOR THE ISOLATION
TITLE OF INVENTION: OF CLONED GENETIC SEQUENCES THAT DETERMINE THESE STRUCTURES
NUMBER OF SEQUENCES: 23

Sequence 11, Application US/10040863

GENERAL INFORMATION:

APPLICANT: Eric H. Holmes et al.

TITLE OF INVENTION: MUCLEIC ACIDS AND PROTEINS OF A RAT GANGLICSIDE

TITLE OF INVENTION: GMI-SPECIFIC ALPHAl-2 FUCOSYLFRANSFERASE AND USES

FILE REFERENCE: 8511-029

CURRENT APPLICATION NUMBER: US/10/040,863

CURRENT PILING DATE: 2001-11.01

PRIOR FILING DATE: 1999-04-23
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 SRGDVVFAGNGIEGSPAKDFALLTQCNHTIMTIGTFGIWAAYLAGGDTIYLANYTLPDSP

LUMENAL, CATALYTIC (POTENTIAL).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                FUNCTION: CREATES A SOLUBLE PRECURSOR OLIGOSACCHARIDE FUC-ALPHA ((1,2)GALBETA-) CALLED THE H ANTIGEN WHICH IS AN ESSENTIAL SUBSTRATE FOR THE FINAL STEP IN THE SOLUBLE A AND B ANTIGEN SINTHESIS PATHWAY. H AND SE BNZTMES FUCOSYLATE THE SAME ACCEPTOR SUBSTRATES BUT EXHIBIT DIFFERENT KN VALUES.

CATALYTIC ACTIVITY: GDP-L-fucose + beta-D-galactosyl-R = GDP + alpha-L-fucosyl-1,2-beta-D-galactosyl-R.
"Sequence and expression of a candidate for the human Secretor blood group alpha(1,2)fucosyltransferase gene (FUT2). Homozygosity for an enzyme-inactivating nonsense mutation commonly correlates with the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ALTHRAY: GLYCOSYLATION
SUBCELLULAR LOCATION: TYPE II MEMBRANE PROTEIN. MEMBRANE-BOUND
SUBCELLULAR LOCATION: TYPE II MEMBRANE PROTEIN. MEMBRANE-BOUND
SUBCELLULAR LOCATION: TYPE II MEMBRANE PROTEIN. MEMBRANE-BOUND
ALTERNATIVE PRODUCTS: TWO FORMS ARE PRODUCED BY THE USE OF
ALTERNATIVE INITIATION CODONS IN THE SAME READING FRAME.
TISSUE SPECIFICITY: SMALL INTESTINE, COLON AND LONG.
MISCELLARBOUS: THERE ARE TWO GENES (FUTI AND FOTZ) WHICH ENCODE
GALACTOSIDE 2-L-FUCOSYLTRANSFERASE. THER ARE EXPRESSED IN A
TISSUE-SPECIFIC MANUER WITH EXPRESSION RESTRICTED TO CELLS OF
MESODERMAL OR ENDODERMAL ORIGIN RESPECTIVELY.
SIMILARITY: BELONGS TO THE GLYCOSYLTRANSFERASE FAMILY 11.

CATALYTIC ACTIVITY: GDP-L-fucose + beta-D-galactosyl-R = GDP + alpha-L-fucosyl-1,2-beta-D-galactosyl-R.
PATHWAY: Glycosylation: TYPE II MEMBRANE PROTEIN. MEMBRANE-BOUND FORM IN TRANS CISTERNAE OF GOLGI (BY SIMILARITY).
MISCELLANEOUS: THERE ARE TWO GENES (FUT1 AND SEC1) WHICH ENCODE GALACTOSIDE 2-L-FUCOSYLTRANSFERASE.
SIMILARITY: BELONGS TO THE GLYCOSYLTRANSFERASE FAMILY 11.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              01-007-1996 (Rel. 34, Created)

Galactoside 2-L-fucosyltransferase 1 (EC 2.4.1.69) (GDP-L-fucose:beta-D-galactoside 2-alpha-L-fucosyltransferase 1)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          PATHWAY: GLYCOSYLATION.
SUBCELLULAR LOCATION: TYPE II MEMBRANE PROTEIN. MEMBRANE-BOUND
SUBCELLULAR LOCATION: TYPE II MEMBRANE PROTEIN. MEMBRANE-BOUND
SUBCELLULAR LOCATION: TYPE II MEMBRANE PROTEIN. MEMBRANE-BOUND
TISSUE SPECIFICITY: IN THE ADULT, HIGHLY EXPRESSED IN PANCREAS,
TESTIS AND EPIDIDYMIS AND TO A LESSER EXTENT IN THYMUS, LONG,
TOWACH, SMALL INTESTINE, COLON, SPLEEN AND UTERUS. NOT EXPRESSED
IN BRAIN, HERRY, SKELETAL MUSCLE, KIDNEY, LIVER AND BONE MARROW.
MISCELLANGOUS: THERE ARE TWO GENES (FUTL AND FUT2) WHICH ENCODE
GALACTOSIDE 2-L-FUCOSYLTRANSFERASE.
SIMILARITY: BELONGS TO THE GLYCOSYLTRANSFERASE FAMILY 11.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               SIGNAL-ANCHOR (TYPE-II MEMBRANE PROTEIN).

Evidence for two distinct alpha(1,2)-fucosyltransferase genes
differentially expressed throughout the rat colon.";
Biochem. J. 300:623-626(1994).

-!-CATALYTIC ACTIVITY. GDP-L-fucose + beta-D-galactosyl-R = GDP +
alpha-L-fucosyl-1,2-beta-D-galactosyl-R.

-!-PATHWAY: Glycosylation.
-!- PATHWAY: Glycosylation.
-!- SUBCELLULAR LOCATION: TYPE II MEMBRANE PROTEIN. MEMBRANE-BOUND
FORM IN TRANS CISTERNAE OF GOLGI (BY SIMILERITY).

-!- GLACTOSIDE 2-L-FUCOSYLTRANSFERASE THEY ARE EXPRESSED IN A
TISSUE-SPECIFIC MANNER WITH EXPRESSION RESTRICTED TO CELLS OF
MESODERMAL OR ENDODERMAL ORIGIN RESPECTIVELY.

-!- SIMILARITY: BELONGS TO THE GLXCOSYLTRANSFERASE FAMILY II.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     15-JUL-1999 (Rel. 38, Last Sequence update)

  Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

This sequence is the human Sec2 protein of the invention. The DNA encodes a alpha(1,2) fucosyltransferase and is the Secretor alpha(1,2)fucosyltransferase locus, that cross hybridises with the H blood group alpha(1,2)fucosyltransferase gene. The DNA is useful for producing a recombinant human GDP-L-fucose.beta-D-galactoside 2-alpha-L-fucosyltransferase (FUT2) which can be used for genotyping an individual as a secretor or nonsecretor as it is known that nonsecretors homozygous for a mutant allele of the FUT2 gene that has a stop codon in the position corresponding to amino acid 143.

  This polypeptide comprises porcine secretor glycosyltransferase (SE or FUT2), a type II integral membrane protein has high affinity of the type I and type III substrates. Its amino acid sequence was deduced from the nucleotide sequence of a genomic DNA clone (see AAV29003) isolated from a pigl liver library on the basis of homology to human FUT2 cDNA. Pig FUT2 shows 83.2% identity with human FUT2. Expression of a glycosyltransferase, such as porcine Se, in a tissue results in reduced expression of unwanted carbohydrate epitopes on the tissue, especially porcine heart, liver, kidney or copitopes on the tissue, especially porcine heart, liver, kidney or epitopes on the tissue, especially porcine heart, liver, kidney or copitopes on the tissue, especially porcine seart, liver, kidney or immunogenic and of increased immunological acceptablity. A claimed method of producing a cell from a donor species that is immunologically acceptable to a recipient species involves reducing levels of carbohydrate on the donor cell that causes it to be recognised as non-self by the recipient by expressing a nucleic acid for a glycosyltransferase such as porcine Se in the cell.

The present sequence represents pig secretor used in an example of the present invention. The present invention describes nucleic acids (NA) encoding a chimeric glycosyltransferase. The NAs comprise a catalytic domain of a first glycosyltransferase (GT) and a localisation signal of a second GT, whereby when the NA is expressed in a cell and where the chimeric enzyme is located in an area of the cell where it is able to compete for substrate with a second GT, resulting in reduced levels of a product from the second GT. The NAs can be used to produce cells and organs with desired glycosylation patterns. Products and methods of the present invention can be used to reduce the levels of undesirable

   (alphal-ZFucT) engages of late out sort specialist alphal-Zenocyticiansterase (alphal-ZFucT) engyme and its corresponding nucleic acid. This nucleic acid is specific for a carbohydrate moiety found in ganglisoside GM1, at terminal galactose betal-3N-acetylgalactosamine (Galbetal-3GalNAc) saccharide. Alphal-ZFucT DNA is useful for producing rat alphal-ZFucT DNA is useful for producing rat alphal-ZFucT protein by recombinant techniques. Alphal-ZFucT DNA is useful for the preparative synthesis of fucosyl containing glycolipids, glycoproteins, glycolipoproteins and oligosaccharide, and for preparing fucosyl-GM1. Alphal-ZFucT DNA is useful for detecting oncogenic transformation which alphal-ZFucT is activated in cell transformation, antisense sequences derived from alphal-ZFucT DNA are useful for inhibiting, suppressing or treating cancer. Alphal-ZFucT DNA is useful in gene therapy and mitisense therapy and antisense therapy. The present sequence is rat hepatoma H35 cell
   Rat hepatoma H35 cell alphal-2fucosyltransferase, useful for producing GMI-specific alphal-2fucosyltransferase enzyme by recombinant techniques and for detecting oncogenic transformation of test tissues

ganglioside GM_1-specific alphal-2 fucosyltransferase protein. The protein or its cellular fraction is useful for synthesis of a molecule comprising Fucalphal-12 Galbetal-3 fallNac, a glycollpid, glycolotein, glycolipoprotein, or a free oligosaccharide comprising Fucalphal-2 Galbetal-3 GalNac. The method involves contacting aphal-2 fucosyltransferase with SDF-1 and a molecule or glycolipid, glycorotein, glycolipoprotein or oligosaccharide having a terminal Galbetal-3 GalNac. It is also useful for synthesis of fucosyl-GM_1 by contacting the protein with GDF-fucose and ganglioside GM_1. The obtained glycoproteins, glycolipids and oligosaccharides are useful as nutritional compositions and fucosyl-GM_1 is useful for inducing an immunotherapeutic or immunosuppressive action against cancer, neurological disease or small cell lung carcinoma.

Swine alpha(1,2)fucosyltransferase, FUT1, Escherichia coli, resistant, E. coli-associated intestinal disorder, E coli infection.
   The present sequence represents swine alpha(1,2) fucosyltransferase (FUT1). The specificatino describes methods relating to Escherichia coli-resistant swine. One of the methods for identifying a swine resistant to E. coli-associated intestinal disorders, comprises determining whether the base at 307 of alpha(1,2) fucosyltransferasel gene (FUT1) is adenine (sic), in which case the swine are resistant. The porcine FUT1 polymorphisms can be used to develop drugs for the treatment of swine having E. coli-associated disease. The methods can also be used in breeding programmes to identify swine with resistance

   A method has been developed for the identification of swine that are resistant to intestinal colonisation by E. coli. The method comprises determining whether a genetic polymorphism associated with resistance to colonisation is present in a swine sample, and then inferring that the swine is resistant if it is homozygues for the polymorphism. The method uses the swine alpha-1,2-fucosyltransferase (FUT1) polymorphism. The present sequence represents swine FUT1. The method enables the breeding

3;
of swine that are resistant to E. coli-related diseases. This method gene. Wore particularly, the agenctic polymorphism in the FUTI gene. Wore particularly, the alentification method identifies swine that are resistant to E. coli-related intestinal disorders if, in a sample taken, the only nitrogen base at residue 307 in the FUTI gene is adenine. Larger amplified fragments from the assay can be used for RELP analysis, and the assay itself is used as a basis for a kit, applied to swine of arganger. The polymorphisms associated with E. coli FHB or receptors. The polymorphisms associated with E. coli fills swine with E. coli-related diseases. However, a mutated form of the from producing the intestinal recentor for FIR was and prevent it from producing the intestinal recentor for FIR was and prevent it
   from producing the intestinal receptor for F18. The detection of polymorphic markers in the method disclosed enables the detection and treatment of E. coli-related intestinal diseases in swine, where there
   has been no success using antibiotics due to unsuccessful prophylaxis

is encoded by CDNA (AAQ99461) isolated from a human epidermal carcinome cell line. The enzyme is responsible for the synthesis of 2'-fucosylactose, one of the oligosaccharides in human milk. Other products of Fuc-T include glycoprotiens contq. beta-linked terminal galactose residues which can be fucosylated by Fuc-T. This DNA can be used to produce non-human transgenic mammals able to produce secondary gene products, e.g. oligosaccharides, in their milk. The transgenic mammals milk biochemically resembles human milk. This humanised milk can be used in the prepn. of an enteral nutritional product useful in the nutritive maintenance of an animal.

   Alpha-1,2-fucosyltransferase (AAR70421) is encoded by a cDNA clone (AAT01082) isolated from a human epidermal carcinoma cell line A431 cDNA library. The enzyme can be expressed in the milk of a transgenic mammal, esp. cow. This allows large-scale prodn oligosaccharides or glycosylated proteins and lipids in the milk.

  The human H-transferase (AAR90572) product of a cDNA clone (AAT12238) prepd. from human epidermoid carcinoma cells (ATCC CRL 155 A-431) can be expressed in xenogenetic organs, tissues and cells using a vector such as papex-1 (AAT12239). This results in decreased expression of the non-human antigen galactose alpha(1,3) galactose on the surface of the organs etc. so that hyperacute rejection is reduced upon transplantation to humans.

GENERAL INFORMATION:

TITLE OF INVENTION: METHODS AND PRODUCTS FOR THE SYNTHESIS

OF OLIGOASCCHARIDE STRUCTURES ON GLYCOPROTEINS,

GLYCOLIPIDS, OR AS FREE MOLECULES, AND FOR THE ISOLATION

OF CLONED GENETIC SEQUENCES THAT DETERMINE THESE STRUCTURES

                                       ALTERNATIVE PRODUCTS: TWO PORMS ARE PRODUCED BY THE USE OF ALTERNATIVE INTITIATION CODONS IN THE SAME READING FRAME.

TISSUE SPECIFICITY: SMALL INTESTINE, COLON AND LUNG.

MISCELLANDOUS: THERE ARE TWO GENES (FUTI AND FUT2) WHICH ENCODE GALACTOSIDE 2-1-FUCGSYLTRANSFERASE. THEY ARE EXPRESSED IN A TISSUE-SPECIFIC MANNER WITH EXPRESSION RESTRICTED TO CELLS OF MESODERMAL ORIGIN RESPECTIVELY.

SIMILARITY: BELONGS TO THE GLYCOSYLTRANSFERASE FAMILY 11.

--- FUNCTION: CREATES A MEMBERANE ASSOCIATED PRECURSOR OLIGOSACCHARIDE FUC-ALPHA((1,2)GALBETA-) CALLED THE H ANTIGEN WHICH IS AN ESSENTIAL SUBSTRATE FOR THE FINAL STEP IN THE MEMBERANE-ASSOCIATED A AND B ANTIGEN SYNTHESIS PATHWAY. H AND SE ENZYMES FUCOSYLATE THE SAME ACCEPTOR SUBSTRATES BUT EXHIBIT DIFFERENT KM VALUES.
--- CATALYTIC ACTIVITY: GDP-L-FUCOSE + BETA-D-GALACTOSYL-R = GDP + ALPHA-L-FUCOSYL-1, 2-BETA-D-GALACTOSYL-R.
--- SUBCELLOLAR LOCATION: TYPE II MEMBRANE PROTEIN. MEMBRANE-BOUND FORM IN TRANS CISTERNAE OF GOLGI.
